

LED LIGHTING CONTROL

Once the LED strip lighting has been installed, connect the extension cable to the strip. Be sure to line up the arrows on the connectors.

Connect the other end of the extension cable to the lighting controller using a small screwdriver. Be sure to follow the color codes on the controller. Black = V+

Plug in the power supply and connect it to an outlet.

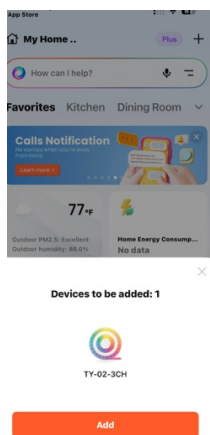

At this point the LED lights should turn on and begin flashing.

Download the Tuya or SmartLife app on your phone to configure the lights.

Once you create an account and are signed into the app, it should automatically find the controller and walk you through the setup and connecting to your WiFi network.

If it does not automatically discover the controller, you can click the + button at the top right corner to search and add it manually.

Once added and configured in the the app you can control the lights using the app or with the included remote control. You can also add them to Amazon Alexa or Google Home to control them with voice commands.
